

AFCP forum on Management of oilseed rape diseases and pests

**Wed 16 June 2021
at University of Hertfordshire, Hatfield, Herts AL10 9AB**

Oilseed rape is a major arable crop globally. However, its yields are threatened by disease and pests. This forum will describe research on strategies to manage such diseases (e.g. light leaf spot, phoma stem canker, clubroot, turnip yellows virus) and pests (e.g. cabbage stem flea beetle). Much of this research is funded by agricultural charities who are members of AFCP.
